

## **Growth Strategy Doc**

We are building a productivity and reflection tool for students and young professionals who want an easier way to track what they planned to do, what they actually did, and reflect on their day without a lot of manual effort. Our product is especially relevant for people who feel overwhelmed by busy schedules, struggle to keep up with traditional productivity tools, or want a clearer picture of how their time is actually spent. Since the product is still early, our goal is to test a few focused acquisition channels that can help us reach users who strongly relate to this problem and are willing to try an early version.

### **Channels**

Instagram influencers: We will work with micro-influencers in productivity, student life, and self-improvement. They can show the product in real daily-life content so users understand how it fits into routines. Success means good engagement, profile visits, and sign-ups from users who already understand the value.

RedNote: We will post story-driven and lifestyle-based content that shows the problem our product solves, such as losing track of what you actually did during the day. This platform is useful for discovery and recommendation. Success means saves, shares, comments, and conversions from users who connect with the use case.

Reddit: We will target productivity, student, and self-improvement communities with problem-first posts and user feedback outreach. Reddit will help us find honest early users and learn how people talk about the problem. Success means comments, DMs, user testing sign-ups, and engaged early adopters.

### **What success looks like**

At this stage, success is not only about getting a large number of users. It is about finding the right users, seeing which channel brings in the most interested and relevant audience, and learning which messaging makes the product easiest to understand. We would measure success through sign-ups, onboarding completion, engagement on posts, user feedback quality, and whether new users understand the core value of the product quickly. A strong success signal would be users saying that the product solves a real problem for them and that they would use it again after trying it once.

## **Cold Start**

### **What is our cold start type?**

We are a single-player productivity tool, so we don't have a classic cold start problem since the app delivers value to one user without needing a network of others, and friends-and-family testing has confirmed the core experience works in isolation. What we do have is a product-side cold start problem: this category lives or dies on how well the app captures real day-to-day needs, and we can't learn that from a handful of friendly testers. Our cold start challenge is solving for feedback velocity, not network density. We need enough real users giving honest feedback to close the product gap before scaling acquisition.

### **Who is our hard side?**

We don't have a marketplace-style hard side, but we do have a scarce, high-leverage segment: early users who will use the app consistently for two-plus weeks and give specific, articulate feedback. Most sign-ups won't do this, but the ones who do are 10–50x more valuable than passive sign-ups right now because they're how we close the product gap. This sharpens our channel strategy. Reddit is the highest-value channel for the hard side because it self-selects for people who care about the problem and can articulate it, while Instagram and RedNote are better for testing messaging and driving volume.

### **What are our two strategies?**

Primary: Single-Player Mode. The app stands alone, so our job is to make the solo experience tight enough that users return without social pressure, measured by retention and feedback quality from solo users rather than virality.

Secondary (deferred): Invite Mechanics. We're not building these yet because we're free (no incentive to dangle) and forced invites without product-market fit tend to leak credibility. We'll revisit invite loops once week-2 retention and unprompted recommendations show the app is genuinely liked, likely tied to a future paid tier.

### **What can we do THIS WEEK?**

Ship 3–5 problem-first posts in Reddit communities (r/productivity, r/getdisciplined, r/college, r/GetStudying) framed around the "what did I actually do today" problem rather than the product, aiming for 5+ DMs from people who relate.
