

Analytics Snapshot — Sift

Date: April 16, 2026 | Team: J Combinator

1. Dashboard Screenshots — Proof of Live Analytics

Firebase / GA4 — Events Config

The screenshot displays the Firebase Analytics 'Events Config' page for the 'sift-mobile' project. The interface includes a sidebar with navigation options like 'Project Overview', 'Settings', and 'What's new'. The main content area shows 'Recommended events' (sign_up, login, share) and a table of 'Key events'.

Event name	Streams active in the last 28 days
app_open	Sift iOS
browse_everything_tapped	Sift iOS
calendar_export	Sift iOS
card_tap	Sift iOS
event_going	Sift iOS
event_saved	Sift iOS
external_event_added	Sift iOS
external_event_extracted	Sift iOS
first_event_viewed	Sift iOS
guest_started	Sift iOS
logged_in_gate_dismissed	Sift iOS
onboarding_started	Sift iOS

Firebase Analytics is live and collecting real data from Sift iOS. 24 distinct custom events are confirmed active in the last 28 days from the Sift iOS stream, including:

app_open, card_tap, event_going, event_saved, external_event_added, external_event_extracted, first_event_viewed, guest_started, logged_in_gate_dismissed, onboarding_started, onboarding_step_2_complete, onboarding_step_3_complete, plan_created, recommendations_viewed, share_intent_received, share_tap, shared_link_opened, sign_in_completed, sign_up_completed, sign_up_started, ticket_click, and 3 more.

Firebase / GA4 — Event Volume (Apr 1 – May 11, 2026)

3,171 total events across 58 total users. Top events by volume:

Event	Count	Users
app_open	928 (29%)	38 (66%)
card_tap	828 (26%)	34 (59%)
recommendations_viewed	465 (15%)	29 (50%)
event_going	234 (7%)	10 (17%)
guest_started	129 (4%)	12 (21%)
sign_in_completed	108 (3%)	13 (22%)
event_saved	83 (3%)	12 (21%)
calendar_export	74 (2%)	10 (17%)
onboarding_started	60 (2%)	9 (16%)

Notable spike: 594 events on April 21 — corresponds to initial user outreach push.

Amplitude — Funnel: Largest Drop-Off

Amplitude confirms the biggest drop-off is step 1 → 2 (app_open → sign_up_completed): 79.1% drop-off since Apr 1. Of 67 users who opened the app, only 14 completed sign-up (20.9%), and only 9 completed onboarding (13.4% total conversion).

Amplitude — Funnel: Slowest Conversion Step

The slowest step is also app_open → sign_up_completed, with a median conversion time of 1 minute 43 seconds. Users who do sign up move through onboarding relatively quickly (median 1m31s), suggesting the barrier is the sign-up gate itself, not the onboarding flow.

Amplitude — Event Segmentation Over Time

Since Apr 1: 67 unique app_open users, 17 sign_up_completed, 15 onboarding_complete. The gap between app_open (blue) and sign_up_completed (green) is visible throughout the entire date range. Row averages: app_open 3.07/day, sign_up_completed 0.49/day, onboarding_complete 0.51/day.

2. Conversion Funnel — Critical Path

Step	Users	Step Conversion	From Top
App opened	67	—	100%
Sign-up completed	14	20.9%	20.9%
Onboarding complete	9	64.3%	13.4%
Event saved	12	—	17.9%
Marked going	10	—	14.9%

Source: Amplitude Funnel (Apr 1 – May 11, 2026). Note: event_saved and event_going exceed onboarding_complete because guest users and direct sign-ins bypass the tracked onboarding flow but still engage with the feed.

3. Written Analysis

Where is the biggest drop-off?

The biggest drop-off is between app open and sign-up — 67 users opened the app but only 14 completed sign-up (20.9%). Amplitude identifies this as both the largest drop-off step (79.1% lost) and the slowest conversion step (median 1m43s). Of the 53 users who did not sign up, 12 fired `guest_started` — they bypassed sign-up entirely. That means roughly 41 users opened the app and left without taking any action at all.

Once users do sign up, the funnel holds reasonably well: 9 of 14 who signed up completed onboarding (64%), and the engaged users are genuinely engaged — 10 users marked going and `calendar_export` numbers match `event_going` exactly, meaning nearly everyone who committed to an event also exported it to their calendar.

What do we think is causing it?

The app opens on a login screen with sign-in as the primary action and "Continue as guest" as a secondary underlined link. Users who open the app for the first time have seen no events, no value, and no reason to create an account. They hit a gate before the product has had a chance to demonstrate why they should stay. The 1m43s median time to sign-up suggests users are hesitating at this screen — reading it, considering it, and most of the time leaving.

The guest path confirms this: users who chose "Continue as guest" went on to tap cards, save events, and mark going — they were willing to engage, just not willing to create an account cold. The sign-up wall is filtering out users who would have become active if they had seen the feed first.

What will we do about it?

Two changes this week:

1. Flip the default to guest mode — open directly on the discovery feed instead of the login screen. Move the sign-up prompt to appear when a user tries to save or mark going for an event. This is the standard pattern for consumer apps (Pinterest, TikTok, Robinhood) and converts at significantly higher rates because users have seen value before being asked to commit. We expect this to reduce the 79.1% drop-off at step 1 substantially.
2. Add a `sign_up_prompted` event that fires when the save/going gate appears for a guest user. This will let us measure the new funnel: `app_open` → `feed engagement` → `sign_up_prompted` → `sign_up_completed`. Right now we cannot see what triggers sign-up intent. This gives us the data to optimize it.
