A note on tooling

The assignment specifies GA4 + Amplitude. We're running **PostHog** instead, single tool that covers both the acquisition-side analytics (traffic sources, sessions, page views) and the in-product event analytics (custom events, funnels, session recordings) the assignment is asking us to demonstrate. We made that call to avoid maintaining two analytics stacks at our team size; flagging it here so it's not hidden. Reddit Ads Manager provides the channel-side ad performance data that GA4 would normally cover for paid traffic.

1. Dashboard screenshots

Reddit Ads Manager — campaign performance (4/23–4/29)

PostHog — site analytics overview (last 7 days)

PostHog — UTM content breakdown (per-creative attribution) + Device split

UTM content ⓘ				Device type ⓘ			
UTM CONTENT	VISITORS	VIEWS		DEVICE TYPE	VISITORS	VIEWS	
triplescreens	44 ↗	46 ↗	View recordings ⓘ	Mobile	42 ↗	44 ↗	View recordings ⓘ
	2 ↗	10 ↗	View recordings ⓘ	Desktop	5 ↗	15 ↗	View recordings ⓘ
tripleswipe	2 ↗	3 ↗	View recordings ⓘ				

2. Funnel with actual numbers

Critical path: **Reddit ad impression** → **ad click** → **landing page visit** → **signup**

Step	Count	Conversion from prior step	Cumulative conversion
Ad impressions	6,742	—	—
Ad clicks	54	0.80%	0.80%
Landing page visitors	47	87%	0.70%
Signups	1	2.1%	0.015%

Per-creative split at the top of the funnel:

Creative	Visitors	Share of traffic
triplescreens (Creative #1)	44	94%
tripleswipe (Creative #2)	2	4%
untagged	2	4%

Personal-graph channel (parallel, partial): ~5–10 DMs sent (under our 30-DM commitment), limited signal. Not enough volume for a meaningful conversion read this window.

Active user definition: `active_users` in `/api/metrics` is a `user_id` that has fired either `add_friend` or `swipe_event` in the last 7 days. The two events are deliberately chosen — `add_friend` captures social-layer engagement (the differentiator), `swipe_event` captures core product engagement (event discovery). Either one counts. The 7-day window means the metric decays if usage stops, so it's a real activity signal and not a cumulative signup proxy.

3. Written analysis

Where is the biggest drop-off?

Landing page to signup. 47 visitors, 1 signup — a ~2% conversion rate. The Reddit ad itself performed above target (0.80% CTR vs. our 0.5% bar), so the channel and creative are doing their job. The leak is on our page, not Reddit's.

A second observation worth noting: 89% of our traffic was mobile (42 of 47 visitors), and our 74% bounce rate was measured against a landing page we had primarily designed and tested on desktop. The drop-off isn't just "page to signup" generically — it's specifically mobile users hitting a page that wasn't built for them.

What do we think is causing it?

Three hypotheses, in order of how confident we are:

1. **Mobile landing page is not optimized for the cold-traffic audience Reddit sent us.** This is the dominant theory. 1m 34s average session means people *did* spend time on the page — they didn't bounce because it loaded slowly. They bounced because what they saw didn't convert. Our user testing in Week 10 was done on the product itself, not the marketing landing page, so we have no qualitative data on why the page fails to close — which is itself a finding.
2. **The value prop on the landing page doesn't match Reddit ad expectations.** Creative #1 ("Escape the group chat") sold a problem; the landing page leads with the product. There's likely a message-match gap between what the ad promised and what the page delivers in the first scroll.
3. **The signup ask is too heavy for cold traffic.** We don't have data to confirm this yet because we don't have funnel events firing inside the signup flow itself — another tracking gap we're closing.

What will we do about it?

Three actions, ordered by how soon we can ship:

1. **Add granular funnel events on the landing page and signup flow this week.** Specifically: `landing_page_viewed`, `signup_started`, `signup_field_completed` (per field), `signup_completed`. Right now we can see that people are dropping between visit and signup but not *where* in the signup flow. We can't fix the leak we can't locate. ETA: in PostHog by end of week.
2. **Mobile landing page rebuild before the next paid campaign.** Above-the-fold value prop tuned for cold NYC-Reddit traffic, signup CTA visible without scroll, page weight under 1MB. We're not running another dollar of Reddit Ads until this ships — the data says we'd be paying \$1.57 per click to send people to a page we already know doesn't convert.
3. **Add an activation step to our funnel reporting.** With the active-user definition now meaningful (`add_friend` or `swipe_event` in last 7 days), we can extend the funnel past

signup: visitor → signup → activated. With our current cohort that's a tiny number, but it makes the next campaign window's data interpretable in a way this one's wasn't.

What this taught us beyond the numbers

The Reddit run was directionally a success at the channel level — CTR, CPC, and creative #1 all cleared their bars. But we ended the week with one signup, which is a useful reminder that channel performance and product performance are different problems. Our analytics setup told us *that* we have a leak; user testing on the landing page itself (which we haven't done) is what will tell us *why*. That's the gap we're closing next.
