

Part 1 - Snapshots

GA4 Acquisition Overview

Amplitude Event Segmentation

The screenshot shows the Amplitude Event Segmentation interface for the 'Default project'. The 'Live Events' section displays a list of events triggered in the product, with 7 users currently live. The table below shows the details of these events.

User Metrics & Analytics Overview

A comprehensive overview of key user metrics including DAU, new users, retention, WAU, session length, and total events.

User Metrics & Analytics Overview

This dashboard tracks **core user engagement and growth metrics** for Tripable. Use it to monitor daily/weekly activity, new user acquisition, retention health, and session engagement.

Part 2 - Funnel With Actual Numbers

For the funnel, we used the latest analytics screenshots from GA4 and Amplitude. GA4 shows 29 active users, 24 new users, 277 views, and 713 events for the recent period, while the longer GA4 report shows 84 active users, 74 new users, 4.4K views, and 14K events from Apr 14–May 11.

Critical Path Funnel

Funnel Step	Number	Conversion from Previous Step
Page views	277	-
Active Users	29	10.5%
New Users	24	82.8%
Signups/ Accounts Created	20	83.3%
Activated Users	7	35.0%

Funnel Definition

Page views: Users visited Tripable pages.

Active users: Users meaningfully engaged with the site during the tracked period.

New users: First-time users who visited Tripable.

Signups / accounts created: Users who created an account.

Activated users: Users who reached the product experience and triggered in-product activity, such as viewing a trip dashboard, clicking into a trip tab, or interacting with Tripable features.

Main Conversion Rates

The largest drop-off is from page views to active users.

Only 29 active users came from 277 views, which is about a 10.5% conversion rate. After users become active, the funnel is much healthier: 24 of 29 active users were new users, and 20 of 24 new users created accounts. The later drop from signups to activated users is also important, with 7 of 20 signed-up users reaching activation.

Part 3 — Written Analysis

Where is your biggest drop-off?

Our biggest drop-off is at the very top of the funnel: page views to active users. We had 277 views, but only 29 active users, which means most people who landed on Tripable did not meaningfully engage with the product.

The second biggest drop-off is from signups to activated users. We had around 20 signed-up users, but only 7 activated users. This means some people were willing to create an account, but did not make it far enough into the product to experience the main value of Tripable.

What do you think is causing it?

For the first drop-off, the likely issue is that the landing page or first screen is not converting visitors quickly enough. People may understand that Tripable is about travel, but they may not immediately understand the specific pain point: planning group trips gets messy when everything is split across group chats, Google Docs, calendar screenshots, and payment apps. If that value is not clear in the first few seconds, people leave before signing up.

For the signup-to-activation drop-off, the issue is probably onboarding. Once users enter the product, they may not know what to do first. Tripable has multiple useful planning features, but that can also make the first experience feel unclear. A new user might wonder whether they should create a trip, invite friends, add dates, build an itinerary, or add expenses first.

In other words, the problem is not just getting traffic. The product needs to guide users to the “aha” moment faster.

What will you do about it?

First, we will make the landing page more direct. The headline and first section should immediately explain the problem and value: Tripable helps friend groups plan trips without losing everything in the group chat. The primary CTA should clearly push users toward creating their first trip.

Second, we will simplify onboarding after signup. Instead of dropping users into a dashboard with many options, we will guide them through one clear flow:

- Create a trip
- Add basic trip details
- Invite friends or copy an invite link
- Choose one first planning action, such as adding availability or an itinerary item

Third, we will improve empty states inside the product. Each blank section should explain what it is for and give one clear next action, such as “Add your first date option,” “Invite friends,” or “Add your first itinerary item.”

For the next test, we will measure whether these changes improve the two weakest points: page view to active user conversion and signup to activation conversion.
